Regularization

EE 5179: Deep Learning for Imaging Instructor: Kaushik Mitra

Generalization

The central challenge of machine learning is to perform well on the - unseen test data, not just the training data

While training the model

What we actually want

Train err
$$\frac{1}{m^{(\text{train})}}||oldsymbol{X}^{(\text{train})}oldsymbol{w} - oldsymbol{y}^{(\text{train})}||_2^2,$$

Test err (or)
Generalization err

$$\frac{1}{m^{(\text{test})}}||\boldsymbol{X}^{(\text{test})}\boldsymbol{w}-\boldsymbol{y}^{(\text{test})}||_2^2.$$

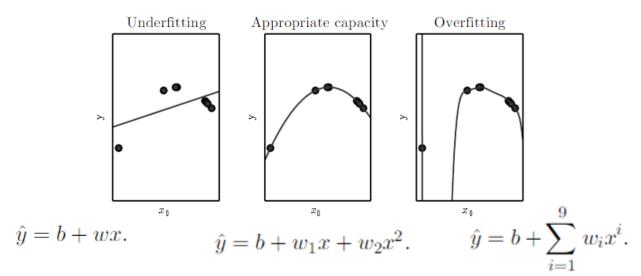

How can we say something about the test data by only seeing the train data?

Statistical learning theory

- Training and Test sets are not arbitrary
- Underlying data generating distribution is same

Capacity, Overfitting and Underfitting

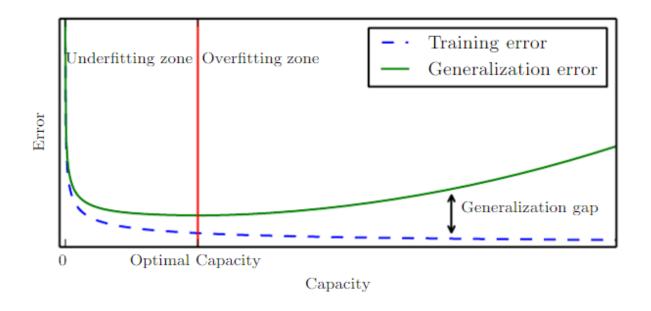

The central challenge of machine learning is to perform well on the *unseen test* data, not just the *training data*

Occam's razor: This principle states that among competing hypotheses that explain known observations equally well, one should choose the "simplest" one.

Capacity, Overfitting and Underfitting

The central challenge of machine learning is to perform well on the *unseen test* data, not just the *training data*

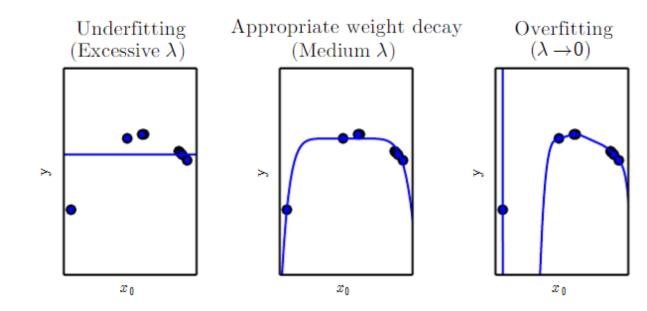

Regularization

Regularization is any modification we make to a learning algorithm that is intended to reduce its generalization error but not its training error

$$J(\boldsymbol{w}) = \text{MSE}_{\text{train}} + \lambda \boldsymbol{w}^{\top} \boldsymbol{w},$$

Note that *biases* in general are not penalized

^{*}Slide courtesy, Ian Goodfellow et al., deep learning book

L_2 norm regularization

(weight decay, ridge regression)

$$\tilde{J}(\boldsymbol{\theta};\boldsymbol{X},\boldsymbol{y}) = J(\boldsymbol{\theta};\boldsymbol{X},\boldsymbol{y}) + \alpha \Omega(\boldsymbol{\theta})$$

$$\tilde{J}(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}) = \frac{\alpha}{2} \boldsymbol{w}^{\top} \boldsymbol{w} + J(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}),$$

Parameter update:

$$\nabla_{\boldsymbol{w}} \tilde{J}(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}) = \alpha \boldsymbol{w} + \nabla_{\boldsymbol{w}} J(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}).$$

$$\boldsymbol{w} \leftarrow \boldsymbol{w} - \epsilon \left(\alpha \boldsymbol{w} + \nabla_{\boldsymbol{w}} J(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}) \right).$$

$$\boldsymbol{w} \leftarrow (1 - \epsilon \alpha) \boldsymbol{w} - \epsilon \nabla_{\boldsymbol{w}} J(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}).$$

$$L_2$$
 norm regularization

$$\tilde{J}(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}) = \frac{\alpha}{2} \boldsymbol{w}^{\top} \boldsymbol{w} + J(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}),$$

Consider:

$$oldsymbol{w}^* = rg\min_{oldsymbol{w}} J(oldsymbol{w})$$
 . Unregularized solution

• Taylor expansion of J at w^* ,

$$\hat{J}(\boldsymbol{\theta}) = J(\boldsymbol{w}^*) + \frac{1}{2}(\boldsymbol{w} - \boldsymbol{w}^*)^{\top} \boldsymbol{H}(\boldsymbol{w} - \boldsymbol{w}^*),$$

 \boldsymbol{H} is hessian of \boldsymbol{J} wrt \boldsymbol{w} at \boldsymbol{w}^* ; linear term?

$$\nabla_{\boldsymbol{w}} \hat{J}(\boldsymbol{w}) = \boldsymbol{H}(\boldsymbol{w} - \boldsymbol{w}^*)$$

• Add the L₂ regularization grad

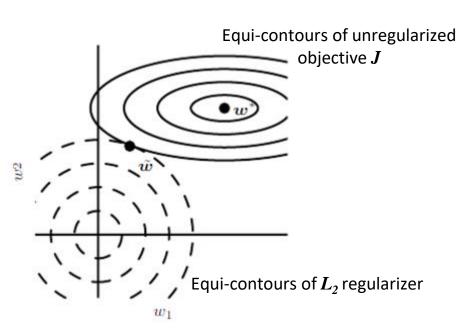

$$\alpha \tilde{\boldsymbol{w}} + \boldsymbol{H}(\tilde{\boldsymbol{w}} - \boldsymbol{w}^*) = 0$$
$$(\boldsymbol{H} + \alpha \boldsymbol{I}) \tilde{\boldsymbol{w}} = \boldsymbol{H} \boldsymbol{w}^*$$
$$\tilde{\boldsymbol{w}} = (\boldsymbol{H} + \alpha \boldsymbol{I})^{-1} \boldsymbol{H} \boldsymbol{w}^*.$$

• Since **H** is real and symmetric

$$\begin{split} \tilde{\boldsymbol{w}} &= (\boldsymbol{Q}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top} + \alpha \boldsymbol{I})^{-1}\boldsymbol{Q}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top}\boldsymbol{w}^{*} \\ &= \left[\boldsymbol{Q}(\boldsymbol{\Lambda} + \alpha \boldsymbol{I})\boldsymbol{Q}^{\top}\right]^{-1}\boldsymbol{Q}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top}\boldsymbol{w}^{*} \\ &= \boldsymbol{Q}(\boldsymbol{\Lambda} + \alpha \boldsymbol{I})^{-1}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top}\boldsymbol{w}^{*}. \end{split}$$

$$L_2$$
 norm regularization

$$\tilde{J}(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}) = \frac{\alpha}{2} \boldsymbol{w}^{\top} \boldsymbol{w} + J(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}),$$

• Since **H** is real and symmetric

$$\tilde{\boldsymbol{w}} = (\boldsymbol{Q}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top} + \alpha\boldsymbol{I})^{-1}\boldsymbol{Q}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top}\boldsymbol{w}^{*}$$

$$= \left[\boldsymbol{Q}(\boldsymbol{\Lambda} + \alpha\boldsymbol{I})\boldsymbol{Q}^{\top}\right]^{-1}\boldsymbol{Q}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top}\boldsymbol{w}^{*}$$

$$= \boldsymbol{Q}(\boldsymbol{\Lambda} + \alpha\boldsymbol{I})^{-1}\boldsymbol{\Lambda}\boldsymbol{Q}^{\top}\boldsymbol{w}^{*}.$$

$$\lambda_{i}/\lambda_{i} + \alpha$$

Regularizer effectively rescales w^* along eigenvectors of H

- $\lambda_i >> \alpha$, regularizer effect is relatively less
- $\lambda_i \ll \alpha$, weights shrink to zero

^{*}Slide courtesy, Ian Goodfellow et al., deep learning book

 L_I norm regularization

$$\tilde{J}(\boldsymbol{\theta}; \boldsymbol{X}, \boldsymbol{y}) = J(\boldsymbol{\theta}; \boldsymbol{X}, \boldsymbol{y}) + \alpha \Omega(\boldsymbol{\theta})$$

$$\Omega(\boldsymbol{\theta}) = ||\boldsymbol{w}||_1 = \sum_i |w_i|,$$

$$\tilde{J}(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}) = \alpha ||\boldsymbol{w}||_1 + J(\boldsymbol{w}; \boldsymbol{X}, \boldsymbol{y}),$$

$$\nabla_{\boldsymbol{w}}\tilde{J}(\boldsymbol{w};\boldsymbol{X},\boldsymbol{y}) = \alpha \operatorname{sign}(\boldsymbol{w}) + \nabla_{\boldsymbol{w}}J(\boldsymbol{X},\boldsymbol{y};\boldsymbol{w})$$

$oldsymbol{L}_I$ norm regularization

• Taylor expansion of J at w^* ,

$$\hat{J}(\boldsymbol{\theta}) = J(\boldsymbol{w}^*) + \frac{1}{2}(\boldsymbol{w} - \boldsymbol{w}^*)^{\top} \boldsymbol{H}(\boldsymbol{w} - \boldsymbol{w}^*),$$

 \boldsymbol{H} is diagonal, with h_{ii} > 0, for all i

• Revisiting L_2 with diagonal \boldsymbol{H}

$$\tilde{w}_i = \frac{H_{i,i}}{H_{i,i} + \alpha} w_i^*$$

Still it only scales the weights - not sparsity

• Now, the L_1 regularized objective

$$\hat{J}(\boldsymbol{\theta}) = J(\boldsymbol{w}^*; \boldsymbol{X}, \boldsymbol{y}) + \sum_{i} \left[\frac{1}{2} H_{i,i} (\boldsymbol{w}_i - \boldsymbol{w}_i^*)^2 + \alpha |w_i| \right]$$

$$w_i = \mathrm{sign}(w_i^*) \max \left\{ |w_i^*| - \frac{\alpha}{H_{i,i}}, 0 \right\} \text{ .solution}$$

• Let $w_i^* > 0$, for all i

$$- \quad \text{if } w_i^* \le \frac{\alpha}{H_{ii}}; \ w_i = 0$$

- esle
$$w_i^* \geq \frac{\alpha}{H_{ii}}$$

$$w_i$$
 moves towards 0 by $\frac{\alpha}{H_{ii}}$

 L_I regularization enforces sparsity in the solution

Bagging - bootstrap aggregating

- Say k regression models
 - Say each of them makes ϵ_i error
 - Error is drawn from Multivariate normal distribution

$$\mathbb{E}[\epsilon_i^2] = v; \quad \mathbb{E}[\epsilon_i \epsilon_j] = c$$

• Avg. error by k models

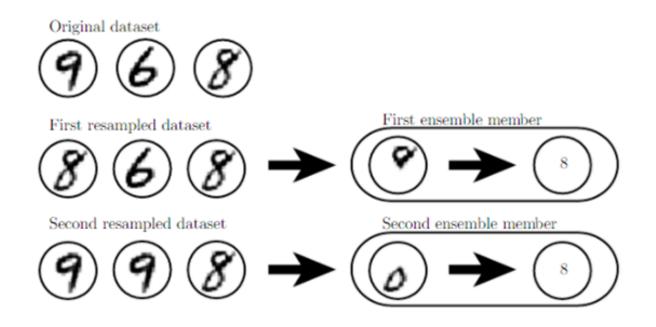

$$(1/k) \sum_{i} \epsilon_{i}$$

 Expected squared error of the ensemble predictor

$$\mathbb{E}\left[\left(\frac{1}{k}\sum_{i}\epsilon_{i}\right)^{2}\right] = \frac{1}{k^{2}}\mathbb{E}\left[\sum_{i}\left(\epsilon_{i}^{2} + \sum_{j\neq i}\epsilon_{i}\epsilon_{j}\right)\right]$$
$$= \frac{1}{k}v + \frac{k-1}{k}c.$$

- If the models are perfectly correlated and c = v, error reduces to v
- If perfectly uncorrelated, c = 0, error reduces to v/k

Bagging - bootstrap aggregating (Breiman, 1994)

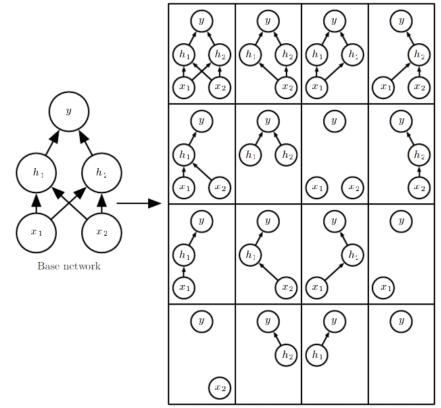

Drop-out (Srivastava et al., 2014)

Stochastically turn the activation of the hidden unit off with a certain probability

$$h^{(k)} = f(Wh^{(k-1)} + b^{(k-1)})$$
$$\hat{h}^{(k)} = \mu^{(k)} \odot h^{(k)}$$

- How to train it?
- Is this same as bagging?

Ensemble of subnetworks

Drop-out (Srivastava et al., 2014)

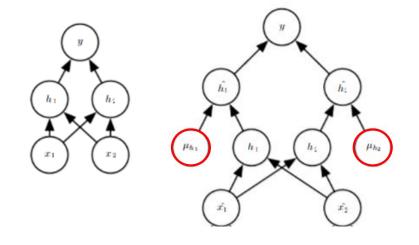

Stochastically turn the activation of the hidden unit off with a certain probability

$$h^{(k)} = f(Wh^{(k-1)} + b^{(k-1)})$$

 $\hat{h}^{(k)} = \mu^{(k)} \odot h^{(k)}$

- Inference, p(y|x)

Bagging
$$\frac{1}{k} \sum_{i=1}^k p^{(i)}(y \mid \boldsymbol{x})$$

Drop-out

$$\sum_{\boldsymbol{\mu}} p(\boldsymbol{\mu}) p(y \mid \boldsymbol{x}, \boldsymbol{\mu})$$

 $p(oldsymbol{\mu})$ - Distribution used to sample $oldsymbol{\mu}$

- Not easy to evaluate, why?
- Do sample averaging

^{*}Slide courtesy, Ian Goodfellow et al., deep learning book

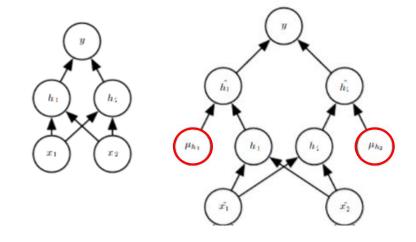

Drop-out (Srivastava et al., 2014)

Stochastically turn the activation of the hidden unit off with a certain probability

$$h^{(k)} = f(Wh^{(k-1)} + b^{(k-1)})$$

 $\hat{h}^{(k)} = \mu^{(k)} \odot h^{(k)}$

We will look at a simple weight scaling result which *approximates* the *geometric mean* of models prediction in one forward pass

Drop-out

$$\sum_{\boldsymbol{\mu}} p(\boldsymbol{\mu}) p(y \mid \boldsymbol{x}, \boldsymbol{\mu})$$

 $p(\mu)$ - Distribution used to sample μ

- Not easy to evaluate, why?
- Do sample averaging

^{*}Slide courtesy, Ian Goodfellow et al., deep learning book

Drop-out (Srivastava et al., 2014)

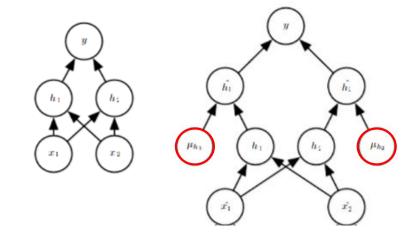

Stochastically turn the activation of the hidden unit off with a certain probability

$$h^{(k)} = f(Wh^{(k-1)} + b^{(k-1)})$$
$$\hat{h}^{(k)} = \mu^{(k)} \odot h^{(k)}$$

Weight rescaling (Hinton et al., 2012)

To evaluate p(y/x) with all units

 Multiply weights going out of unit i with probability of including unit i

Drop-out

$$\sum_{\boldsymbol{\mu}} p(\boldsymbol{\mu}) p(y \mid \boldsymbol{x}, \boldsymbol{\mu})$$

 $p(oldsymbol{\mu})$ - Distribution used to sample $oldsymbol{\mu}$

- Not easy to evaluate, why?
- Do sample averaging

^{*}Slide courtesy, Ian Goodfellow et al., deep learning book

Drop-out (Srivastava et al., 2014)

Stochastically turn the activation of the hidden unit off with a certain probability

unnormalized probability

$$\tilde{p}_{\text{ensemble}}(y \mid \boldsymbol{x}) = \sqrt[2^d]{\prod_{\boldsymbol{\mu}} p(y \mid \boldsymbol{x}, \boldsymbol{\mu})}$$

Uniform probability of masking

$$p_{\text{ensemble}}(y \mid \boldsymbol{x}) = \frac{\tilde{p}_{\text{ensemble}}(y \mid \boldsymbol{x})}{\sum_{y'} \tilde{p}_{\text{ensemble}}(y' \mid \boldsymbol{x})}.$$

^{*}Slide courtesy, Ian Goodfellow et al., deep learning book

Drop-out (Srivastava et al., 2014)

In case of linear hidden units, the weight scale inference is exact.

For example, consider a softmax regression classifier

$$P(y = i)$$

$$P(y = y \mid \mathbf{v}) = \operatorname{softmax} \left(\mathbf{W}^{\top} \mathbf{v} + \mathbf{b} \right)_{y}$$

$$P(y = y \mid \mathbf{v}; \mathbf{d}) = \operatorname{softmax} \left(\mathbf{W}^{\top} (\mathbf{d} \odot \mathbf{v}) + \mathbf{b} \right)_{y}$$

$$\tilde{P}_{\text{ensemble}}(y = y \mid \mathbf{v}) = \sqrt[2^n]{\prod_{\mathbf{d} \in \{0,1\}^n} P(y = y \mid \mathbf{v}; \mathbf{d})}$$

$$= \sqrt[2^n]{\prod_{\mathbf{d}\in\{0,1\}^n} \operatorname{softmax} (\mathbf{W}(\mathbf{d}\odot\mathbf{v})^\top + \mathbf{b})_y}$$

$$= \sqrt[2^n]{\prod_{\mathbf{d}\in\{0,1\}^n} \operatorname{softmax} (\mathbf{W}(\mathbf{d}\odot\mathbf{v})^\top + \mathbf{b})_y}$$

$$= \sqrt[2^n]{\prod_{\boldsymbol{d}\in\{0,1\}^n} \operatorname{softmax} (\boldsymbol{W}(\boldsymbol{d}\odot\boldsymbol{v}) + \boldsymbol{b})_y}$$

$$= \sqrt[2^n]{\prod_{\boldsymbol{d}\in\{0,1\}^n} \frac{\exp \left(\boldsymbol{W}_{y,:}^\top (\boldsymbol{d}\odot\boldsymbol{v}) + b_y\right)}{\sum_{y'} \exp \left(\boldsymbol{W}_{y',:}^\top (\boldsymbol{d}\odot\boldsymbol{v}) + b_{y'}\right)}}$$

$$= \frac{\sqrt[2^n]{\prod_{\boldsymbol{d}\in\{0,1\}^n} \exp \left(\boldsymbol{W}_{y,:}^\top (\boldsymbol{d}\odot\boldsymbol{v}) + b_y\right)}}{\sqrt[2^n]{\prod_{\boldsymbol{d}\in\{0,1\}^n} \sum_{y'} \exp \left(\boldsymbol{W}_{y',:}^\top (\boldsymbol{d}\odot\boldsymbol{v}) + b_{y'}\right)}}$$

$$\tilde{P}_{ ext{ensemble}}(\mathbf{y} = y \mid \mathbf{v}) \propto \sqrt[2^n]{\prod_{\boldsymbol{d} \in \{0,1\}^n} \exp\left(\boldsymbol{W}_{y,:}^{\top}(\boldsymbol{d} \odot \mathbf{v}) + b_y\right)}$$

 $= \exp \left(\frac{1}{2^n} \sum_{\boldsymbol{d} \in \{0,1\}^n} \boldsymbol{W}_{y,:}^{\top} (\boldsymbol{d} \odot \mathbf{v}) + b_y \right)$

$$= \exp\left(\frac{1}{2}\mathbf{W}_{y,:}^{\top}\mathbf{v} + b_y\right).$$
